Watching Neural Networks Learn

Left to Right: Kyle, Dom, George, Joey

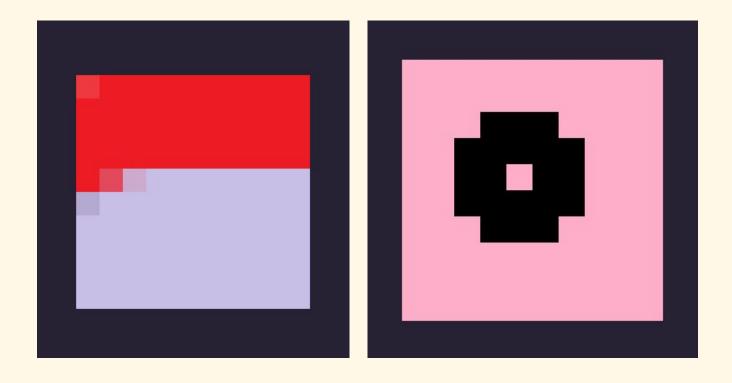

What Are Neural Networks?

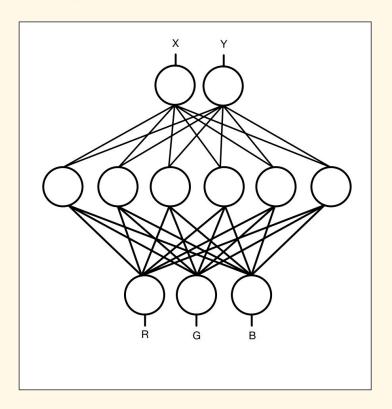

A method in AI that teaches computers to learn in a way similar to a brain. It uses nodes called "neurons" interconnected in a layered structure that resembles a brain. It creates a system that computers use to continuously improve by learning from their mistakes.

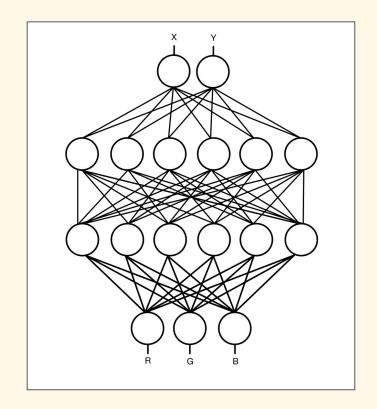

End Goal of Our Network

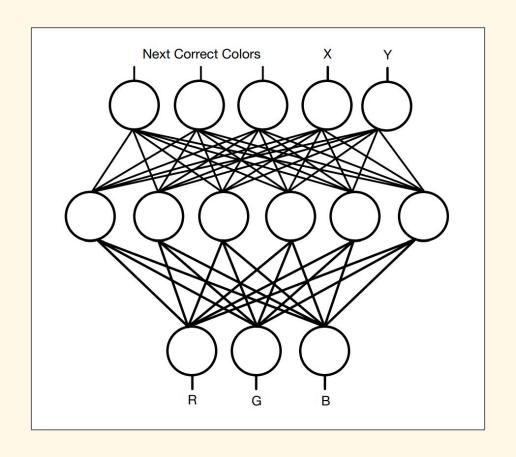

Testing Different Network Structures

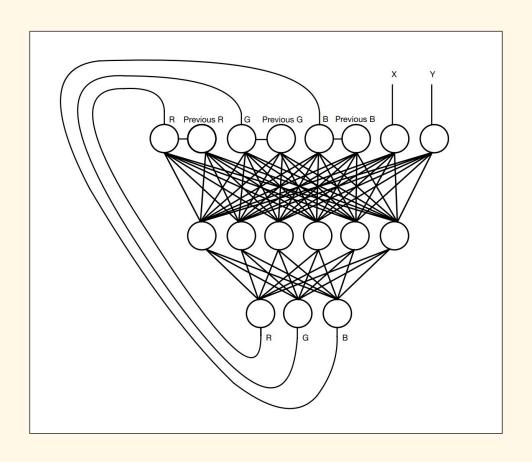

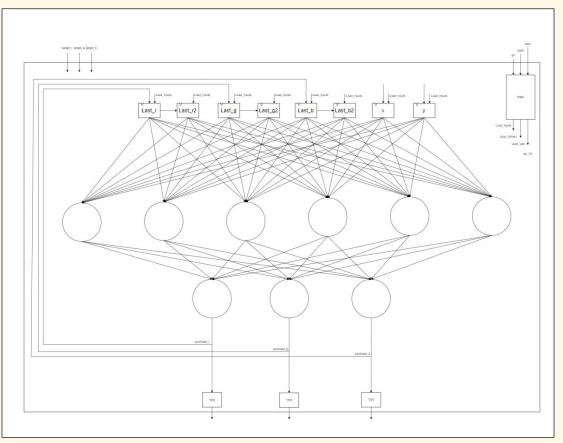

First Successful Network

Moving to Hardware

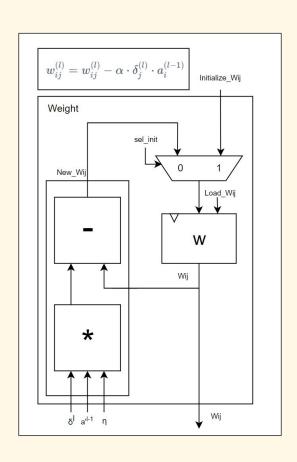

Complete Neuron

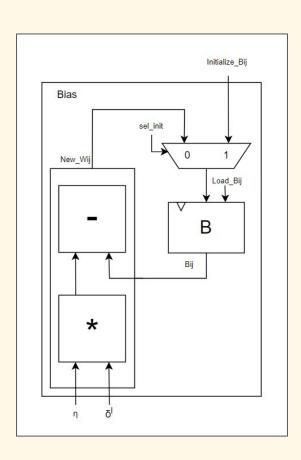

Output Layer Neuron

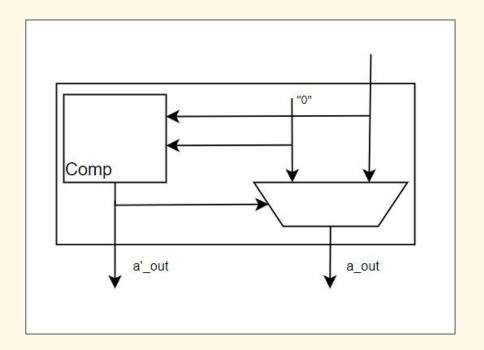

Neuron Weight

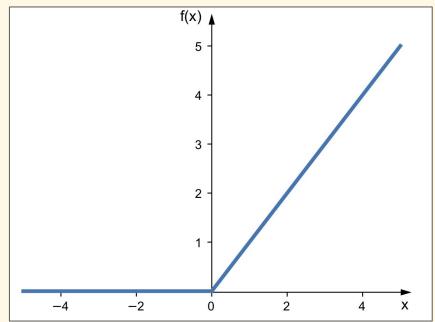

Neuron Bias:

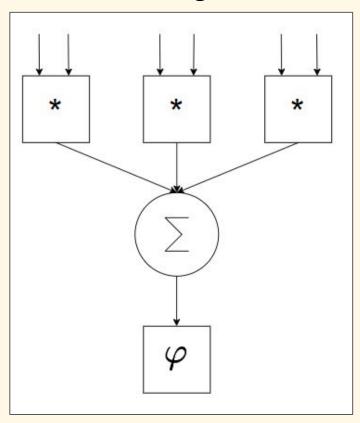

Neuron Activation Function

Neuron Weighted Summer

The forward propagation process is completed when the input data has passed through each layer and the final output is obtained.

Back Propagation

 Backwards Propagation is the process of adjusting the neural network weights to predict the output better

$$egin{aligned} \delta_{ ext{red}}^{(L)} &= rac{\partial J}{\partial R_{ ext{pred}}} = R_{ ext{pred}} - R_{ ext{target}} \ \delta_{ ext{green}}^{(L)} &= rac{\partial J}{\partial G_{ ext{pred}}} = G_{ ext{pred}} - G_{ ext{target}} \ \delta_{ ext{blue}}^{(L)} &= rac{\partial J}{\partial B_{ ext{pred}}} = B_{ ext{pred}} - B_{ ext{target}} \end{aligned}$$

$$\delta_i^{(L)} = rac{\partial J}{\partial z_i^{(L)}}$$

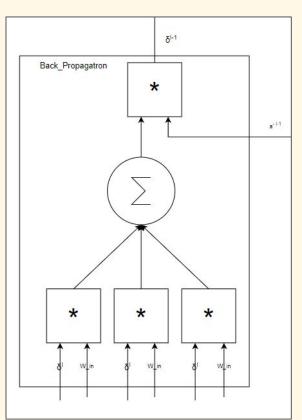

Assuming a squared error loss function:

$$J = rac{1}{2} \sum_{i=1}^{n^{(L)}} (a_i^{(L)} - y_i)^2$$

The sensitivity is then:

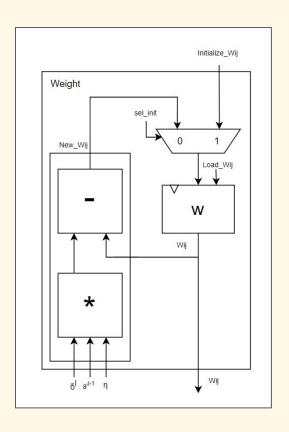

$$\delta_i^{(L)} = (a_i^{(L)} - y_i) \cdot g'(z_i^{(L)})$$

Backwards Propagating Sensitivity

$$\delta_j^{(l+1)} = g'^{(l+1)}(z_j^{(l+1)}) \sum_k w_{jk}^{(l+1)} \delta_k^{(l+2)}$$

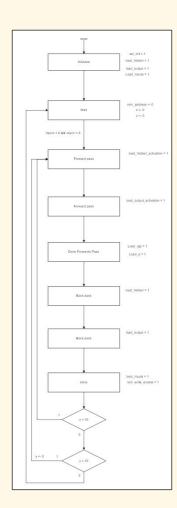

Adjusting the Weights and Bias

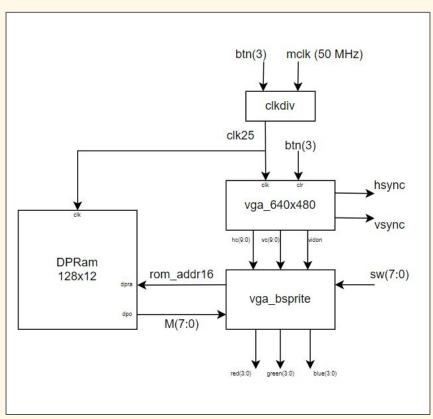

$$w_{ij}^{(l)} = w_{ij}^{(l)} - \alpha \cdot \delta_j^{(l)} \cdot a_i^{(l-1)}$$

$$b_j^{(l)} = b_j^{(l)} - \alpha \cdot \delta_j^{(l)}$$
